ABSTRACT

A multifunction printer enables the printing of time-based media and is operated via a user interface. The user interface includes a touch screen for accepting command inputs and providing information to a user. Time-based media data is received by the printer from a media source specified via the user interface. A user specifies one or more multimedia processing functions for the printer to apply to the data. The printer performs the specified functions, and previews the output to the user via a display of the user interface. If the user decides to print the previewed output, the user specifies one or more output devices, such that the printer can print conventional printed output and/or to a specified electronic output.

User Interface 110
This application claims the benefit of the following provisional patent applications, each of which is incorporated by reference in its entirety: U.S. Provisional Application No. 60/506,206, filed Sep. 25, 2003; U.S. Provisional Application No. 60/506,263, filed Sep. 25, 2003; U.S. Provisional Application No. 60/506,302, filed Sep. 25, 2003; U.S. Provisional Application No. 60/506,303, filed Sep. 25, 2003; and U.S. Provisional Application No. 60/506,411, filed Sep. 25, 2003.

This application is also related to the following applications, each of which was filed on Mar. 30, 2004, and is incorporated by reference herein in its entirety: application Ser. No. 10/814,931, entitled “Printer Having Embedded Functionality For Printing Time-Based Media”, application Ser. No. 10/814,500, entitled “User Interface For Networked Printer,” application Ser. No. 10/814,842, entitled “Stand Alone Multimedia Printer With User Interface For Allocating Processing,” application Ser. No. 10/814,842, entitled “Printer with Multimedia Server,” and application Ser. No. 10/814,944 entitled, “Multimedia Print Driver Dialog Interfaces”.

BACKGROUND OF THE INVENTION

1. Field of the Invention

This invention relates generally to printers that have embedded functionality for printing time-based media, and in particular to a user interface for operating a printer that prints time-based media resulting in a combination of a printed output and a related electronic data output.

2. Description of the Related Art

Conventional printers receive documents in a variety of formats and print the contents of the documents in accordance with a proper format. For example, a printer enabled to print Portable Document Format (PDF) documents will correctly recreate the original appearance of the document, regardless of the platform being used to view the document.

Today, as more databases and computer networks are interconnected, people often have multiple data systems and destinations in which to store information. For example, a person may receive an email containing information that he wants to retain. The person may want to print some or all of the information. The person may further want to add the information to a database or to send the information to other people or destinations or to add the information to a web page. Currently, the person will need to execute several different software programs and will need to type multiple commands into the programs. He may also need to re-enter the information into one or more programs. This is not efficient and is prone to human error, since human beings occasionally forget to perform one of more of the tasks usually associated with a received document and are also prone to making typographical errors.

Some conventional printers incorporate a management function in which the printer monitors its own internal functions and displays an alert if, for example, its toner is low or it is out of paper. This action is based on the printer doing “self-monitoring,” not on any monitoring of the documents to be printed.

While conventional printers can print documents in a wide variety of formats, these printers are fundamentally limited in their ability to reproduce different kinds of media. For example, it is standard technology for a printer to produce images of static text, pictures, or a combination of the two. But because these printers print onto paper or another similar fixed medium, they cannot record the nuances of time-based media very well.

In developing a printer that is equipped to print time-based media without the limitations of conventional printers, a user interface for such a printer is needed. It is further desirable that such a user interface be operable with a printer that performs at least some of the necessary processing itself rather than require an attached computer or other device to perform all of the processing.

SUMMARY OF THE INVENTION

A multifunction printer enables the printing of time-based media. In a typical hardware configuration for such a multifunction printer, a printer includes a print engine that produces a paper or other printed output and one or more electronic devices produce a related electronic output. Together, the printed and electronic outputs provide an improved representation of the time-based media over that of a conventional paper printer.

A user interface provides access to functionality of the printer. In a preferred embodiment, the user interface includes a touch screen for accepting command inputs and providing information to a user. In an alternative embodiment, input is provided by way of a keypad, keyboard, or other input device.

Time-based media data is received by the printer from a media source specified via the user interface. A user specifies one or more multimedia processing functions for the printer to apply to the data. The printer performs the specified functions, and previews the output to the user via a display of the user interface. If the user decides to print the previewed output, the user specifies one or more output devices, such that the printer can print conventional printed output and/or to a specified electronic output.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 is a block diagram illustrating a printer having a user interface in accordance with an embodiment of the present invention.

FIG. 2 illustrates an overview of a generalized process for creating a representation of time-based media data in accordance with an embodiment of the present invention.

FIG. 3 illustrates an example of a user interface for selecting an input source in accordance with an embodiment of the present invention.

FIG. 4 illustrates a user interface display for selecting an audio multimedia processing function in accordance with an embodiment of the present invention.

FIG. 5 illustrates a user interface display for selecting a video multimedia processing function in accordance with an embodiment of the present invention.

FIG. 6 illustrates a user interface display for previewing output in accordance with an embodiment of the present invention.

FIG. 7 illustrates a user interface display for selecting output devices for printing in accordance with an embodiment of the present invention.

The figures depict preferred embodiments of the present invention for purposes of illustration only. One skilled in the art will readily recognize from the following discussion that alternative embodiments of the structures and methods illustrated herein may be employed without departing from the principles of the invention described herein.
DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

Various embodiments of a multifunction printer enable the printing of time-based media in a useful and intelligent format. To create a representation of this time-based media, the printer produces a printed output and a related electronic output, which together provide a representation of the received media. Depending on the desired application for the printer, the printer may include any number of devices for receiving the media, printing the printed output, and producing the electronic output. The described user interface is meant to be generally applicable not only to the specific combinations of input and output devices described herein, but also to additional combinations not specifically disclosed, as would be understood by those of skill in the art from the present disclosure.

Printer Architecture

FIG. 1 is a high-level diagram of one embodiment of the printer 100. Printer 100 includes a media source interface 105, a user interface 110, a printed output system 115, an electronic output system 120, and a media processing system 125. Capable of receiving time-based media 150, the media source interface 105 can take a variety of forms and may include one or more devices that can receive media data or create media data by observing a media event. Similarly, the printed output system 115 and the electronic output system 120 can take a variety of forms and may each include one or more devices that can produce, respectively, a printed output and an electronic output.

In one embodiment, the media processing system 125 includes a memory 130, a processor 135, and one or more embedded functionality modules 140. The embedded functionality modules 140 may include software, hardware, or a combination thereof for implementing at least a portion of the functionality of the multifunction printer 100. The media processing system 125 is coupled to the media source interface 105 and the user interface 110, allowing it to communicate with each of those devices. The media processing system 125 is also coupled to the printed output system 115 and to the electronic output system 120 for providing the appropriate commands and data to those systems.

Printer 100 is further described in related application, “Printer Having Embedded Functionality for Printing Time-Based Media,” filed Mar. 30, 2004, Ser. No. 10/814,931, which application is incorporated by reference in its entirety.

FIG. 2 illustrates an overview of a generalized process in which the printer 100 creates a representation of time-based media data 150, in accordance with one embodiment of the invention. First in the illustrated embodiment, time-based media data is received 202 by the printer 100. Using UI 110, a user selects 204 a processing function to be performed on the data. Printer 100 then performs 206 the specified processing function, and previews 208 the output for the user. If the user is satisfied with the data as previewed, he selects 210 one or more output devices to which to send the time-based media data, and finally instructs printer 100 to output 212 the data. Each of the above steps is now described in greater detail.

User Interface (UI) 110 of printer 100 preferably includes a screen on which information can be conveyed to the user. UI 110 preferably also includes a mechanism for allowing a user to input responses and make selections. In a preferred embodiment, printer UI 110 includes a touch screen, and the user makes selections and inputs responses by touching the appropriate part of the screen. In one embodiment, a keypad is also provided for entry of alphanumeric data. In an alternate embodiment, a joystick, trackball or other input device can be used to provide input and make selections.

FIG. 3 illustrates an example of a user interface 110 for selecting an input source. Display 302 of UI 110 includes an instruction to the user to “select input source”, and several selections for the user to choose from. In the illustrated embodiment, the user can select from CD 304, DVD 306, VCR 308 Line In 310, Direct Memory Device 318 and Bluetooth device 320. Those of skill in the art will appreciate that in other embodiments, other input sources will be available. Also shown is a Cancel button 312, should the user wish to cancel the action of selecting an input source, and a Continue button 314 for finalizing the selection. In a preferred embodiment, the user makes a selection by touching the appropriate button on the screen. In an alternative embodiment, the user can make the selection by pressing an appropriate button on keypad 316.

Once a data source has been specified so that data can be received 202, a multimedia processing function is selected. In a preferred embodiment, processing functions include audio range selection and video range selection.

Audio Range Selection

In a preferred embodiment, printer 100 is capable of performing many kinds of multimedia processing functions on the audio selection. Available functions preferably include event detection, speaker segmentation, speech recognition, and speaker recognition, with sound source location, speech recognition and profile analysis. As can be seen in FIG. 4, user interface 110 provides a user with the ability to select from among these options. In FIG. 4, display 302 of UI 110 includes a user instruction 402, instructing the user to select the desired multimedia processing function. Display 302 also includes the available options, which are illustrated on screen 110. In print segment 403, event detection 404, sound source location 406, speaker recognition 408, and profile analysis 410, speech recognition 412, and speaker segmentation 414 are provided. A button 318 is also provided in one embodiment to allow the current input to be changed, as described above with respect to FIG. 3. Finally, a cancel button 312 is available to allow the user to back to a previous screen, and a continue button 314 is available to be selected when the user has specified all of the desired processing functions.

Selecting one of the multimedia processing functions displays a submenu for the user specific to that processing function. In one embodiment, if a user selects the Print Segment button 403 on display 302, a display appears on display 302 showing an audio waveform and additionally providing slider controls with which the user can select portions of the current input to print. The manner in which output is created by the printer is discussed below.

Selecting the Event Detection button 404 displays a dialog to the user showing the results of applying audio event detection, such as clapping, yelling, or laughing, along a timeline. Each detected event is preferably accompanied by a confidence that it was detected correctly. The display 302 also includes a slider that lets the user adjust a threshold on the confidence values. As the slider is moved, events that are above threshold are displayed. The audio file is then preferably segmented into clips that bound the above-threshold events. In one embodiment, the display 302 also includes a series of check boxes that let the user choose which events to display.

Selecting the Speaker Segmentation button 414 presents a dialog showing the results of applying speaker segmentation along a timeline. Each segment is preferably shown in a
Selecting the Speaker Recognition button 408 displays a dialog showing the results of applying speaker recognition along a timeline. In a preferred embodiment, the name of each speaker is accompanied by a confidence that it was detected correctly. The dialog preferably includes a series of check boxes that let the user choose which speakers to display, as well as a slider that lets the user adjust a threshold on the confidence values. As the slider is moved, speaker names that are above threshold are displayed. The audio file is segmented into clips that bound the above-threshold speaker identities.

In another embodiment, Speaker Segmentation and Speaker Recognition functions can be combined. In such an embodiment, a dialog shows the results of applying speaker segmentation and speaker recognition along a timeline. Each segment is shown in a different color and segments that were produced by the same speaker are shown in the same color. Each segment is accompanied by a confidence that the segmentation is correct. The speaker recognition results include text and optionally confidence values for each speaker name. Multiple speaker names could be associated with each segment. The user interface includes sliders that let the user adjust thresholds on confidence values. As the sliders are moved, speaker segments or speaker recognition results that are “above threshold” are displayed.

Selecting the Sound Source Locator button 406 displays a dialog showing the results of applying sound source localization along a timeline. The direction from which sound was detected is displayed as a sector of a circle. Each sector is accompanied by a confidence that it was detected correctly. The dialog additionally preferably includes a series of check boxes arranged around the circumference of a prototype circle that let the user choose which directions to display.

In another embodiment, Event Detection and Sound Source Locator functions can be combined. In such an embodiment, a dialog shows the results of applying sound source localization and audio event detection along a timeline. The direction from which sound was detected is displayed as a sector of a circle. Each sector is accompanied by a confidence that it was detected correctly. The user interface includes a series of check boxes arranged around the circumference of a prototype circle that let the user choose which directions to display. Each detected event is accompanied by a confidence that it was detected correctly. The user interface includes a series of check boxes that let the user choose which events (e.g., clapping, yelling, laughing) to display.

If a user selects the Speech Recognition button 412, a dialog shows the results of applying speech recognition along a timeline. This includes text and optionally confidence values for each word or sentence. The dialog preferably includes a slider that lets the user adjust a threshold on the confidence values. As the slider is moved, words that are above threshold are displayed. The audio file is segmented into clips that bound the above-threshold words.

In another embodiment, the speech recognition results are matched against results from a Profile Analysis 410, in which a pre-existing text-based profile that represents the user’s interests. The dialog includes a slider that lets the user adjust a threshold on the confidence values. Another slider adjusts a threshold on the degree of match between the profile and the speech recognition results. As the sliders are moved, words that are above threshold are displayed.

In another embodiment, the user interface also shows the results of applying audio event detection, such as clapping, yelling, or laughing, along a timeline in combination with speech recognition, speaker segmentation, or speaker recognition. Each detected event is accompanied by a confidence that it was detected correctly. The user interface includes sliders that let the user adjust thresholds on the confidence values.

In another embodiment, the functions of Event Detection, Speech Recognition and Speaker Recognition can be combined. In such an embodiment, a dialog shows the results of applying speech recognition along a timeline, and additionally shows the results of applying audio event detection, such as clapping, yelling, or laughing, along a timeline; and the results of applying speaker recognition along the timeline. The dialog includes a series of check boxes that let the user choose which speakers to display, and additionally includes sliders that let the user adjust thresholds on the confidence values.

In another embodiment, Event Detection, Speech Recognition, and Speaker Segmentation can be combined. In such an embodiment, a dialog shows the results of applying speech recognition along a timeline, and additionally shows the results of applying audio event detection, such as clapping, yelling, or laughing, along a timeline, and also displays the direction from which sound was detected as a sector of a circle. The dialog includes a series of check boxes arranged around the circumference of a prototype circle that let the user choose which directions to display. The dialog includes sliders that let the user adjust thresholds on the confidence values.

Video Range Selection

In a preferred embodiment, printer 100 is capable of performing many multimedia processing functions on a video selection. Available functions preferably include event detection, color histogram analysis, face detection, face recognition, optical character recognition (OCR), motion analysis, distance estimation, foreground/background segmentation, scene segmentation, automobile recognition and license plate recognition. As can be seen in FIG. 5, the user interface 110 provides a user with the ability to select from among these options. In FIG. 5, display 302 of UI 110 includes a user instruction 502, instructing the user to select the desired multimedia processing function. Display 302 also includes the available options, which in the illustrated case are selectable via buttons for Print Segment 503, Event Detection 524, Color Histogram Analysis 526, Foreground/Background Segmentation 514, Scene Segmentation 518, Automobile Recognition 516, and license plate recognition 520. A button 418 is also provided in one embodiment to allow the current input to be changed, as described above with respect to FIG. 3. Finally, a cancel button 312 is available that returns the user to a previous screen, and a continue button 314 is available to select when the user has specified all of the desired processing functions.

Selecting one of the multimedia processing functions displays a submenu for the user specific to that processing function.
In one embodiment, if a user selects the Print Segment button 403, dialog box 302 shows key frames along a timeline and has slider controls that let the user select portions of a given video file to print. The manner in which output is created by the printer is discussed below.

Selecting the Event Detection button 524 displays a dialog showing the results of applying a video event detection algorithm along a timeline. Examples of video events include cases when people stand up during a meeting or when they enter a room. A slider control is preferably provided to let the user select portions of a given video file to print, based on a confidence value.

Selecting the Color Histogram button 526 presents a dialog showing the results of applying a color histogram analysis algorithm along a timeline. For example, a hue diagram is shown at every 30-second interval. This allows a user to quickly locate the portions of a video that contain sunsets, for example. A slider control is preferably provided that lets the user select portions of a given video file to print, based on the histogram computation.

Selecting the Face Detection button 504 displays a dialog showing segments along a timeline that contain face images. Each segment is preferably accompanied by an integer that expresses the number of faces detected in the clip as well as a confidence value. Slider controls are preferably provided that let the user select portions of a given video file to print, based on the confidence values. In another embodiment, the face images are clustered so that multiple instances of the same face are merged into one representation face image.

Selecting the Face Recognition button 522 presents a dialog showing names along a timeline that were derived by application of face recognition to video frames at corresponding points along the timeline. Slider controls are preferably provided that let the user select portions of a given video file to print. Also, a series of checkboxes are provided that let the user select clips by choosing names.

Selecting the OCR button 512 causes each frame in the video to be OCR’d and subsampled, for example once every 30 frames, and the results displayed along a timeline. Slider controls are preferably provided to let the user select portions of a given video file to print based on the confidence values that accompany the OCR results. A text entry dialog is also preferably provided to let the user enter words that are searched within the OCR results. Clips that contain the entered text are indicated along the timeline. In one embodiment, results of the OCR function are clustered so that similar OCR results are merged.

Selecting the Motion Analysis button 506 displays a dialog showing the results of applying a motion analysis algorithm along a timeline. One type of motion analysis that can be used is a waveform having a magnitude that indicates the amount of detected motion. This allows a user to quickly locate the portions of a video that contain a person running across the camera’s view, for example. A slider control preferably lets the user select portions of a given video file to print, based on the amount of motion that was detected.

Selecting the Distance Estimation button 510 presents a dialog showing the results of applying a distance estimation algorithm along a timeline. For example, in a surveillance camera application using two cameras separated by a known distance, the distance of each point from the camera can be estimated. A slider control preferably lets the user select portions of a given video file to print, based on their distance from the camera. For example, the user may wish to see only objects that are more than 50 yards away from the camera.

In one embodiment, the motion analysis algorithm and distance estimation algorithm are applied together.

Selecting the Foreground/Background Segmentation button 514 displays a dialog showing the results of applying a foreground/background segmentation algorithm along a timeline. At each point, the foreground objects are displayed. A clustering and merging algorithm can be applied across groups of adjacent frames to reduce the number of individual objects that are displayed. Slider controls are preferably provided to let the user select portions of a given video file to print based on the confidence value of the foreground/background segmentation as well as the merging algorithm.

Selecting the Scene Segmentation button 518 presents a dialog showing the results of applying a shot segmentation algorithm along a timeline. Each segment can be accompanied by a confidence value that the segmentation is correct. A slider control is preferably provided to let the user select portions of a given video file to print, based on the confidence value.

Selecting the Visual Inspection button 528 presents a dialog showing an image from an attached video camera. The user can outline areas of the scene and define parameters for the objects that could appear in those areas. For example, for circular objects, a slider control preferably lets a user choose the diameter and allowable variations. This can be applied to automatic inspection of objects on an assembly line such as ball bearings that should be perfectly circular with a diameter of 2.54 centimeters. The user can also choose actions that are executed when the selected parameters are exceeded. For example, a frame image should be grabbed and printed if a ball bearing is detected with a diameter different from the defined value by more than 0.01 centimeters. Also, an email can be sent to a specified user.

In one embodiment, scene segmentation can be combined with face recognition. In such an embodiment, each segment can be accompanied by a confidence value that the segmentation is correct. The results of face recognition are shown as names along the timeline. Slider controls are preferably provided to let the user select portions of a given video file to print, based the confidence values of shot segmentation and face recognition. Additionally, a series of checkboxes are provided to let the user select clips by choosing names.

In another embodiment, scene segmentation can be combined with face detection such that color or a special icon indicates segments on the timeline that contain face images. Each segment can be accompanied by an integer that expresses the number of faces detected as well as a confidence value. Slider controls are preferably provided to let the user select portions of a given video file to print based on the confidence values of shot segmentation and face detection.

In another embodiment, scene segmentation and OCR can be combined. In such an embodiment, a dialog shows the results of applying a shot segmentation algorithm along a timeline. Each segment can be accompanied by a confidence value that the segmentation is correct. Each frame in the video is OCR’d and subsampled, for example once every 30 frames, and the results are displayed along the timeline. A text entry dialog is also provided that lets the user enter words to be searched within the OCR results. Clips that contain the entered text are indicated along the timeline. Slider controls are preferably provided to let the user select portions of a given video file to print based on the confidence values that accompany the shot segmentation and OCR results. In another embodiment, names are also shown on the timeline that were derived by application of face recognition to video frames. Additionally, a series of checkboxes are provided that let the user select clips by choosing names. Slider controls are provided that let the user select portions of a given video file...
those sections that contain a specific object, for example a red timeline.

In another embodiment, scene segmentation, OCR and face detection are combined. In that embodiment, segments on the timeline that contain face images are shown. Each segment can be accompanied by an integer that expresses the number of faces detected in the clip as well as a confidence value. Slider controls are preferably provided to let the user select portions of a given video file to print based on the confidence values that accompany the shot segmentation, OCR, and face detection results.

Selecting the Automobile Recognition button 516 displays a dialog for configuring and using the automobile recognition function. In one embodiment, a user operates a surveillance camera that creates many hours of video, most of which is not of interest to the user. The user needs to find and print only those sections that contain a specific object, for example a red Cadillac. For this purpose, each frame in the video is input to an automobile recognition technique and the results are displayed along a timeline. Slider controls are preferably provided to let the user select portions of a given video file to print based on the confidence values that accompany the automobile recognition results. A text entry dialog is also preferably provided that lets the user enter identifiers for the make, model, color, and year for an automobile that are searched within the automobile recognition results. Clips that contain the entered information are indicated along the timeline.

In another embodiment, a user often needs to find and print only those sections that contain a specific license plate number. For this purpose, a user can select the License Plate Recognition button 520. Each frame in the video is input to a license plate recognition technique and the results, typically a plate number, state, plate color, name and address of plate holder, outstanding arrest warrants, criminal history of the plate holder, etc., are displayed along a timeline. Slider controls are preferably provided to let the user select portions of a given video file to print based on the confidence values that accompany the license plate recognition results. A text entry dialog is also provided that lets the user enter identifiers for the plate number, state, and year, etc. for a license plate that are searched within the license plate recognition results. Clips that contain the entered information are indicated along the timeline.

In another embodiment, a user needs to find and print only those sections that contain a specific object, such as a speeding red Cadillac. The automobile recognition function can be combined with motion analysis for this purpose. Each frame in the video is preferably input to an automobile recognition technique and the results are displayed along a timeline. Additionally, a motion analysis technique is applied to the video to estimate the automobile's speed from one frame to the next. Slider controls are preferably provided that let the user select portions of a given video file to print based on the confidence values that accompany the automobile recognition and motion analysis results. A text entry dialog is also provided that lets the user enter identifiers for the make, model, color, and year for an automobile and its speed that are searched within the automobile recognition and motion analysis results. Clips that contain the entered information are indicated along the timeline.

After the user has selected one or more multimedia processing functions to apply, printer 100 performs the selected functions and produces a preview of the result. FIG. 6 illustrates an example of a previewed result. In FIG. 6, display 302 shows a preview 602 of the output that will be printed, as well as a Continue button 314, a Cancel button 312 and a Back button 604. If the user does not like the previewed output 602, he can select the Back button 604, which in a preferred embodiment returns the user to the previous screen. Alternatively, the user can press the Cancel button 312 to cancel the print operation completely. If the user wants to continue with the print job, he selects the Continue button 314 to go on. As those of skill in the art will recognize, the particular preview 602 depends on the features that were applied. In the illustrated example of FIG. 6, sound localization and motion detection have been employed to create the displayed page.

Once the user is satisfied with the previewed output 602 and selects the Continue button, the next task in a preferred embodiment is to select the output path. In a preferred embodiment, output can be directed along a printed output path 160, an electronic output path 170, or both.

Referring now to FIG. 7, there is shown an example of a display 302 of a user interface 110 in which a user can select an output path. By selecting the Printed Output button 702, data will be routed to the printed output system 115 and be printed in a conventional manner by printer 100. If the user selects one of the buttons associated with the electronic output system 120, data will be routed to the particular output device selected. In the illustrated case of FIG. 7, the user can select a DVD-ROM drive 706, an Audio Cassette 708, VRH 710, Optical Storage 712, Flash Memory 714, or Bluetooth device 716. Once the user has made his selection, he presses the Print button 704 to send the output to the selected locations, or Cancel 312 to quit.
Various general-purpose systems may also be used with pro-
tems.

Accordingly, the disclosure of the present invention is
provided for disclosure of enablement and best mode of the
present invention.

The present invention also relates to an apparatus for per-
forming the operations herein. This apparatus may be spe-
cially constructed for the required purposes, or it may com-
prise a general-purpose computer selectively activated or
reconfigured by a computer program stored in the computer.
Such a computer program may be stored in a computer read-
able storage medium, such as, but is not limited to, any type of
disk including floppy disks, optical disks, CD-ROMs, mag-
etic-optical disks, read-only memories (ROMs), random
access memories (RAMs), EPROMs, EEPROMs, magnetic
or optical cards, application specific integrated circuits
(ASICs), or any type of media suitable for storing electronic
instructions, and each coupled to a computer system bus.
Furthermore, the computers referred to in the specification
may include a single processor or may be architectures
employing multiple processor designs for increased comput-
ing capability.

The algorithms and displays presented herein are not inher-
ently related to any particular computer or other apparatus.
Various general-purpose systems may also be used with pro-
grams in accordance with the teachings herein, or it may
prove convenient to construct more specialized apparatus to
perform the required method steps. The required structure for
a variety of these systems will appear from the description
above. In addition, the present invention is not described with
reference to any particular programming language. It is
appreciated that a variety of programming languages may be
used to implement the teachings of the present invention as
described herein, and any references to specific languages are
provided for disclosure of enablement and best mode of the
present invention.

Finally, it should be noted that the language used in the
specification has been principally selected for readability and
instructional purposes, and may not have been selected to
delineate or circumscribe the inventive subject matter.
Accordingly, the disclosure of the present invention is
intended to be illustrative, but not limiting, of the scope of the
invention.

We claim:

1. A multifunction printer for printing time-based media,
the multifunction printer comprising:

- a communication interface for receiving time-based media
data from a media source;
- a user interface display on the multifunction printer that
displays a function selection menu comprising a plurality
of user-selectable audio and video range selection functions
to be applied to the time-based media by a
processor within the multifunction printer;
- an input device for receiving from a user a selection of a
multimedia function from the plurality of user-select-
able video and audio range selection functions displayed
on the function selection menu;
- the processor within the multifunction printer for perfor-
ming the multimedia function selected from the plurality
of user-selectable video and audio range selection func-
tions and for generating a printable representation compris-
ing results of the multimedia function applied to the
time-based media;

a first output device for receiving the printable representa-
tion from the processor and for automatically printing
the printable representation to a tangible medium; and

a second output device coupled to the processor for receiv-
ing the printable representation from the processor and
for outputting an electronic output including the print-
able representation.

2. The printer of claim 1 wherein the multimedia function
includes instructions for selecting a range of audio data in
response to the user selecting one of the audio range selection
functions from the function selection menu.

3. The printer of claim 1 wherein the multimedia function
further includes instructions for determining a confidence
level associated with the audio event detection.

4. The printer of claim 3 wherein the multimedia function
includes instructions for applying a speaker recognition
function to the time-based media data.

5. The printer of claim 3 wherein the multimedia function
includes instructions for applying a speaker segmentation
function to the time-based media data.

6. The printer of claim 1 or 5 wherein the multimedia
function includes instructions for applying a speaker recog-
nition function to the time-based media data.

7. The printer of claim 1 wherein the multimedia function
includes instructions for applying a sound source localization
function to the time-based media data.

8. The printer of claim 7 wherein the multimedia function
further includes instructions for applying audio event detection
to the time-based media data.

9. The printer of claim 1 wherein the multimedia function
includes instructions for applying a speech recognition
function to the time-based media data.

10. The printer of claim 9 wherein the multimedia function
includes instructions for applying a profile analysis function
to the time-based media data.

11. The printer of claim 9 wherein the multimedia function
includes instructions for applying an audio event detection
function to the time-based media data.

12. The printer of claim 11 wherein the multimedia func-
tion further includes instructions for applying a speaker rec-
ognition function to the time-based media data.

13. The printer of claim 11 wherein the multimedia func-
tion further includes instructions for applying a speaker seg-
mentation function to the time-based media data.

14. The printer of claim 11 wherein the multimedia func-
tion further includes instructions for applying a sound local-
ization function to the time-based media data.

15. The printer of claim 1 wherein the multimedia function
includes instructions for selecting a range of video data in
response to the user selecting one of the audio range selection
functions from the function selection menu.

16. The printer of claim 1 wherein the multimedia function
includes instructions for applying a video event detection
function to the time-based media data.

17. The printer of claim 1 wherein the multimedia function
includes instructions for applying a color histogram analysis
function to the time-based media data.

18. The printer of claim 1 wherein the multimedia function
includes instructions for applying a face detection function
to the time-based media data.

19. The printer of claim 1 wherein the multimedia function
includes instructions for applying a clustering function to the
time-based media data to merge multiple instances of a
face into a representative face image.
20. The printer of claim 1 wherein the multimedia function includes instructions for applying a face recognition function to the time-based media data.

21. The printer of claim 1 wherein the multimedia function includes instructions for applying an optical character recognition function to the time-based media data.

22. The printer of claim 21 wherein the multimedia function further includes instructions for applying a clustering function to the time-based media data to merge similar results of the optical character recognition.

23. The printer of claim 1 wherein the multimedia function includes instructions for applying a motion analysis function to the time-based media data.

24. The printer of claim 1 or claim 23 wherein the multimedia function includes instructions for applying a distance estimation function to the time-based media data.

25. The printer of claim 1 wherein the multimedia function includes instructions for applying a face detection function to the time-based media data.

26. The printer of claim 25 wherein the multimedia function further includes instructions for applying a face recognition function to the time-based media data.

27. The printer of claim 26 wherein the multimedia function further includes instructions for applying a scene segmentation function to the time-based media data.

28. The printer of claim 26 wherein the multimedia function further includes instructions for applying a face detection function to the time-based media data.

29. The printer of claim 26 wherein the multimedia function includes instructions for applying an optical character recognition function to the time-based media data.

30. The printer of claim 29 wherein the multimedia function further includes instructions for applying a face recognition function to the time-based media data.

31. The printer of claim 29 wherein the multimedia function includes instructions for applying a face detection function to the time-based media data.

32. The printer of claim 1 wherein the multimedia function includes instructions for applying an automobile recognition function to the time-based media data.

33. The printer of claim 32 wherein the multimedia function further includes instructions for applying a face recognition function to the time-based media data.

34. The printer of claim 1 wherein the multimedia function includes instructions for applying a license plate recognition function to the time-based media data.

35. The printer of claim 1 wherein the multimedia function includes instructions for applying a visual inspection function to the time-based media data.

36. The printer of claim 1 wherein the user interface display is configured to allow a user to control a compact disc (CD) device.

37. The printer of claim 1 wherein the user interface display is configured to allow a user to control a digital video disc (DVD) device.

38. The printer of claim 1 wherein the user interface display is configured to allow a user to control an audio tape device.

39. The printer of claim 1 wherein the user interface display is configured to allow a user to control a multimedia server.

40. The printer of claim 1 wherein the user interface display is configured to allow a user to control encryption hardware.

41. The printer of claim 1 wherein the user interface display is configured to allow a user to control motion detection hardware.

42. The printer of claim 1 wherein the user interface display is configured to allow a user to control audio sound localization hardware.

43. The printer of claim 1 wherein the user interface display is configured to allow a user to control motion detection hardware.

44. The printer of claim 1 wherein the user interface display is configured to allow a user to control a MIDI player.

45. The printer of claim 1 wherein the user interface display is configured to allow a user to control a cellular telephone.

46. The printer of claim 1 wherein the user interface display is configured to allow a user to control a two-way radio.

47. The printer of claim 1 wherein the user interface display is configured to allow a user to control a world wide web display.

48. The printer of claim 1 wherein the user interface display is configured to allow a user to control a climate sensor.

49. The printer of claim 1 wherein the user interface display is configured to allow a user to control a radio receiver.

50. The printer of claim 1 wherein the second output device is a DVD drive.

51. The printer of claim 1 wherein the second output device is a CD drive.

52. The printer of claim 1 wherein the second output device is an audio tape drive.

53. The printer of claim 1 wherein the second output device is a video cassette device.

54. The printer of claim 1 wherein the second output device is a removable device.

55. The printer of claim 1 wherein the second output device is an embedded audio recorder.

56. The printer of claim 1 wherein the second output device is an embedded video recorder.

57. The printer of claim 1 wherein the second output device is a non-volatile storage device.

58. The printer of claim 1 wherein the second output device is an embedded multimedia server.

59. The printer of claim 1 wherein the second output device is an embedded multimedia server.

60. The printer of claim 1 wherein the second output device is video encryption hardware.

61. The printer of claim 1 wherein the second output device is audio sound localization hardware.

62. The printer of claim 1 wherein the second output device is a cellular telephone.

63. The printer of claim 1 wherein the second output device is a two-way radio.

64. The printer of claim 1 wherein the second output device is a world-wide web display.

65. The printer of claim 1 wherein the second output device is a radio receiver for receiving AM signals.

66. The printer of claim 1 wherein the second output device is a radio receiver for receiving FM signals.

67. The printer of claim 1 wherein the second output device is a radio receiver for receiving short wave signals.

68. The printer of claim 1 wherein the second output device is a satellite radio receiver.

69. The printer of claim 1 wherein the second output device is a weather alert receiver.

70. The printer of claim 1 wherein the second output device is an emergency alert monitor for receiving emergency broadcast system alerts.

71. The printer of claim 1 wherein the second output device is hardware for performing VGA screen captures.

72. The printer of claim 1 wherein the second output device is hardware for performing audio capture.

73. The printer of claim 1 wherein the second output device is hardware for capturing data from an electronic pen.

74. The printer of claim 1 wherein the second output device is a disposable media writer.
75. The printer of claim 1 wherein the second output device is a flash memory device.

76. The printer of claim 1 wherein the second output device is a wireless device.

77. The multifunction printer of claim 1, wherein the user interface display on the multifunction printer further displays an input source selection menu comprising a plurality of user-selectable input sources, wherein the input device further receives a selection of an input source from the plurality of user-selectable input sources, and wherein the communication interface receives the time-based media data from the input source selected by the user.

78. The multifunction printer of claim 1, wherein the user interface display on the multifunction printer further displays an output source selection menu comprising a plurality of user-selectable electronic output sources, wherein the input device further receives a selection of an electronic output source from the plurality of user-selectable output sources, and wherein the second output device outputs the electronic output to the electronic output source selected by the user.

79. The multifunction printer of claim 1, wherein the user interface display outputs the function selection menu responsive to the user selecting the input source using the input source selection menu.

80. The multifunction printer of claim 1, wherein the user interface display outputs the output source selection menu responsive to the user selecting the multimedia function using the function selection menu.

81. The multifunction printer of claim 1, wherein the user interface display on the multifunction printer further displays a sub-menu for displaying options to the user specific to the user-selected multimedia function, wherein the sub-menu is displayed responsive to the user selecting one of the video range selection functions and the audio range selection functions from the function selection menu.

82. The multifunction printer of claim 1, wherein the user interface display on the multifunction printer further displays a preview menu for displaying a preview of the printable representation responsive to the user selecting the multimedia function using the function selection menu.

83. The multifunction printer of claim 1, wherein the preview includes a timeline of the multimedia data indicating results of applying the multimedia function to the time-based media data along the timeline.

84. The multifunction printer of claim 1, wherein the preview includes user-selectable options for refining parameters of the multimedia function, the user interface display updating the timeline responsive to the user changing the parameters.

85. The multifunction printer of claim 1, wherein the plurality of user-selectable audio range selection functions on the function selection menu displayed by the user interface display on the multifunction printer comprises at least one of an event detection function, a speaker segmentation function, a speaker recognition function, a sound source location function, a speech recognition function, and a profile analysis function.

86. The multifunction printer of claim 1, wherein the plurality of user-selectable video range selection functions on the function selection menu displayed by the user interface display on the multifunction printer comprises at least one of an event detection function, a color histogram analysis, a face detection function, a face recognition function, an optical character recognition function, a motion analysis function, a distance estimation function, a foreground/background segmentation function.

87. The multifunction printer of claim 1, wherein the user interface display further displays a user-selectable print function for printing the printable representation, and wherein the first output device prints the printable representation responsive to the input device receiving a selection of the print function from the user.

88. A method for printing time-based media, the method comprising:
receiving time-based media data from a media source;
displaying, on a user interface display of a multifunction printer, a function selection menu comprising a plurality of user-selectable audio and video range selection functions to be applied to the time-based media;
receiving a user selected multimedia function, wherein the user selected multimedia function is a function selected from the plurality of user-selectable audio range and video range selection functions displayed on the function selection menu;
performing, by the multifunction printer, the user selected multimedia function on the time-based media data;
generating, by the multifunction printer, a printable representation comprising results of the user selected multimedia function applied to the time-based media;
printing the printable representation to a tangible medium; and
outputting an electronic output of the printable representation.

89. The method of claim 88 wherein the multimedia function includes instructions for selecting a range of audio data in response to a user selecting one of the audio range selection functions from the function selection menu.

90. The method of claim 88 wherein the multimedia function includes instructions for applying audio event detection to the time-based media data.

91. The method of claim 88 wherein the multimedia function further includes instructions for determining a confidence level associated with the audio event detection.

92. The method of claim 88 wherein the multimedia function includes instructions for applying a speaker segmentation function to the time-based media data.

93. The method of claim 88 or 92 wherein the multimedia function includes instructions for applying a speaker recognition function to the time-based media data.

94. The method of claim 88 wherein the multimedia function includes instructions for applying a sound source localization function to the time-based media data.

95. The method of claim 94 wherein the multimedia function includes instructions for applying a speaker segmentation function to the time-based media data.

96. The method of claim 88 wherein the multimedia function includes instructions for applying a speaker recognition function to the time-based media data.

97. The method of claim 96 wherein the multimedia function includes instructions for applying a profile analysis function to the time-based media data.

98. The method of claim 96 wherein the multimedia function includes instructions for applying an audio event detection function to the time-based media data.

99. The method of claim 98 wherein the multimedia function further includes instructions for applying a speaker recognition function to the time-based media data.

100. The method of claim 98 wherein the multimedia function further includes instructions for applying a speaker segmentation function to the time-based media data.

101. The method of claim 98 wherein the multimedia function further includes instructions for applying a sound localization function to the time-based media data.
102. The method of claim 88 wherein the multimedia function includes instructions for selecting a range of video data in response to a user selecting one of the audio range selection functions from the function selection menu.

103. The method of claim 88 wherein the multimedia function includes instructions for applying a video event detection function to the time-based media data.

104. The method of claim 88 wherein the multimedia function includes instructions for applying a face detection function to the time-based media data.

105. The method of claim 88 wherein the multimedia function includes instructions for applying a color histogram analysis function to the time-based media data.

106. The method of claim 105 wherein the multimedia function includes instructions for applying a clustering function to the time-based media data to merge multiple instances of a face into a representative face image.

107. The method of claim 88 wherein the multimedia function includes instructions for applying a face recognition function to the time-based media data.

108. The method of claim 88 wherein the multimedia function includes instructions for applying an optical character recognition function to the time-based media data.

109. The method of claim 108 wherein the multimedia function further includes instructions for applying a clustering function to the time-based media data to merge similar results of the optical character recognition.

110. The method of claim 88 wherein the multimedia function includes instructions for applying a motion analysis function to the time-based media data.

111. The method of claim 88 or claim 110 wherein the multimedia function includes instructions for applying a distance estimation function to the time-based media data.

112. The method of claim 88 wherein the multimedia function includes instructions for applying foreground/background segmentation function to the time-based media data.

113. The method of claim 88 wherein the multimedia function includes instructions for applying a scene segmentation function to the time-based media data.

114. The method of claim 113 wherein the multimedia function further includes instructions for applying a face recognition function to the time-based media data.

115. The method of claim 113 wherein the multimedia function further includes instructions for applying a face detection function to the time-based media data.

116. The method of claim 113 wherein the multimedia function includes instructions for applying an optical character recognition function to the time-based media data.

117. The method of claim 116 wherein the multimedia function further includes instructions for applying a face recognition function to the time-based media data.

118. The method of claim 116 wherein the multimedia function includes instructions for applying a face detection function to the time-based media data.

119. The method of claim 116 wherein the multimedia function includes instructions for applying an automobile recognition function to the time-based media data.

120. The method of claim 119 wherein the multimedia function further includes instructions for applying a motion analysis function to the time-based media data.

121. The method of claim 88 wherein the multimedia function includes instructions for applying a license plate recognition function to the time-based media data.

122. The method of claim 88 wherein the multimedia function includes instructions for applying a visual inspection function to the time-based media data.
